

Tribboo Kanban Board

The proposed exercise is to implement the following frame through react components.

Every task will have the following format:

```
{
  idTask: uuid,
  taskName: "Piscina",
  description: "Lorem ipsum dolor sit...",
  startAt : Date(),
  endAt: Date(),
  status: TODO|IN_PROCESS|DONE,
  phase: N
}
```

Tasks can be moved from one state to another, you can use any state management you want.

Deliver the exercise with a CRA project, where the only page is the view given. Provide the link to the github repository as an answer.

As a fake backend you can use the attached json file.

Thanks for applying and happy hacking.
